Abstract. The objective of the present paper is to study the η -Ricci solitons on Kenmotsu manifold with generalized symmetric metric connection of type (α, β) . Ricci and η -Ricci solitons with generalized symmetric metric connection of type (α, β) have been discussed, satisfying the conditions $\bar{R}.\bar{S}=0, \ \bar{S}.\bar{R}=0, \ \bar{W}_2.\bar{S}=0$ and $\bar{S}.\bar{W}_2=0$. Finally, we have constructed an example of Kenmotsu manifold with generalized symmetric metric connection of type (α, β) admitting η -Ricci solitons.

Keywords: Kenmotsu manifold; Generalized symmetric metric connection; η -Ricci soliton; Ricci soliton, Einstein manifold.

1. Introduction

A linear connection $\overline{\nabla}$ is said to be generalized symmetric connection if its torsion tensor T is of the form

$$(1.1) T(X,Y) = \alpha \{u(Y)X - u(X)Y\} + \beta \{u(Y)\varphi X - u(X)\varphi Y\},$$

for any vector fields X,Y on a manifold, where α and β are smooth functions. φ is a tensor of type (1,1) and u is a 1-form associated with a non-vanishing smooth non-null unit vector field ξ . Moreover, the connection $\overline{\nabla}$ is said to be a generalized symmetric metric connection if there is a Riemannian metric g in M such that $\overline{\nabla}g=0$, otherwise it is non-metric.

In the equation (1.1), if $\alpha = 0$ ($\beta = 0$), then the generalized symmetric connection is called β - quarter-symmetric connection (α - semi-symmetric connection), respectively. Moreover, if we choose (α, β) = (1,0) and (α, β) = (0,1), then the generalized symmetric connection is reduced to a semi-symmetric connection and quarter-symmetric connection, respectively. Therefore, a generalized symmetric

Received September 03, 2018; accepted January 01, 2019 2010 Mathematics Subject Classification. 53C05, 53D15, 53C25.

connections can be viewed as a generalization of semi-symmetric connection and quarter-symmetric connection. These two connections are important for both the geometry study and applications to physics. In [12], H. A. Hayden introduced a metric connection with non-zero torsion on a Riemannian manifold. The properties of Riemannian manifolds with semi-symmetric (symmetric) and non-metric connection have been studied by many authors (see [1], [9], [10], [24], [26]). The idea of quarter-symmetric linear connections in a differential manifold was introduced by S.Golab [11]. In [23], Sharfuddin and Hussian defined a semi-symmetric metric connection in an almost contact manifold, by setting

$$T(X,Y) = \eta(Y)X - \eta(X)Y.$$

In [13], [25] and [19] the authors studied the semi-symmetric metric connection and semi-symmetric non-metric connection in a Kenmotsu manifold, respectively.

In the present paper, we have defined new connection for Kenmotsu manifold, generalized symmetric metric connection. This connection is the generalized form of semi-symmetric metric connection and quarter-symmetric metric connection.

On the other hand, a Ricci soliton is a natural generalization of an Einstein metric. In 1982, R. S. Hamilton [14] said that the Ricci solitons moved under the Ricci flow simply by diffeomorphisms of the initial metric, that is, they are sationary points of the Ricci flow:

(1.2)
$$\frac{\partial g}{\partial t} = -2Ric(g).$$

Definition 1.1. A Ricci soliton (g, V, λ) on a Riemannian manifold is defined by

$$\mathcal{L}_V g + 2S + 2\lambda = 0,$$

where S is the Ricci tensor, \mathcal{L}_V is the Lie derivative along the vector field V on M and λ is a real scalar. Ricci soliton is said to be shrinking, steady or expanding according as $\lambda < 0$, $\lambda = 0$ and $\lambda > 0$, respectively.

In 1925, H. Levy [16] in Theorem 4, proved that a second order parallel symmetric non-singular tensor in real space forms is proportional to the metric tensor. Later, R. Sharma [22] initiated the study of Ricci solitons in contact Riemannian geometry. After that, Tripathi [28], Nagaraja et. al. [17] and others like C. S. Bagewadi et. al. [4] extensively studied Ricci solitons in almost contact metric manifolds. In 2009, J. T. Cho and M. Kimura [6] introduced the notion of η -Ricci solitons and gave a classification of real hypersurfaces in non-flat complex space forms admitting η -Ricci solitons. η - Ricci solitons in almost paracontact metric manifolds have been studied by A. M. Blaga et. al. [2]. A. M. Blaga and various others authors have also studied η -Ricci solitons in manifolds with different structures (see [3], [20]). It is natural and interesting to study η -Ricci solitons in almost contact metric manifolds with this new connection.

Therefore, motivated by the above studies, in this paper we will study the η -Ricci solitons in a Kenmotsu manifold with respect to a generalized symmetric metric

connection. We shall consider η -Ricci solitons in the almost contact geometry, precisely, on an Kenmotsu manifold with generalized symmetric metric connection which satisfies certain curvature properties: $\bar{R}.\bar{S}=0$, $\bar{S}.\bar{R}=0$, $W_2.\bar{S}=0$ and $\bar{S}.\bar{W}_2=0$ respectively.

2. Preliminaries

A differentiable M manifold of dimension n=2m+1 is called almost contact metric manifold [5], if it admits a (1,1) tensor field ϕ , a contravaryant vector field ξ , a 1-form η and Riemannian metric g which satisfies

$$\begin{array}{rcl}
(2.1) & \phi \xi & = & 0, \\
(2.2) & \eta(\phi X) & = & 0
\end{array}$$

$$\eta(\phi A) = 0$$

$$(2.3) \eta(\xi) = 1,$$

$$\phi^2(X) = -X + \eta(X)\xi,$$

$$(2.5) g(\phi X, \phi Y) = g(X, Y) - \eta(X)\eta(Y),$$

$$(2.6) g(X,\xi) = \eta(X),$$

for all vector fields X, Y on M. If we write $g(X, \phi Y) = \Phi(X, Y)$, then the tensor field ϕ is a anti-symmetric (0,2) tensor field [5]. If an almost contact metric manifold satisfies

$$(2.7) \qquad (\nabla_X \phi) Y = g(\phi X, Y) \xi - \eta(Y) \phi X,$$

(2.8)
$$\nabla_X \xi = X - \eta(X)\xi,$$

then M is called a Kenmotsu manifold, where ∇ is the Levi-Civita connection of g [18].

In Kenmotsu manifolds the following relations hold [18]:

$$(2.9) (\nabla_X \eta) Y = g(\phi X, \phi Y)$$

$$(2.10) \quad g(R(X,Y)Z,\xi) = \eta(R(X,Y)Z) = g(X,Z)\eta(Y) - g(Y,Z)\eta(X),$$

$$(2.11) R(\xi, X)Y = \eta(Y)X - g(X, Y)\xi,$$

(2.12)
$$R(X,Y)\xi = \eta(X)Y - \eta(Y)X,$$

$$(2.13) R(\xi, X)\xi = X - \eta(X)\xi,$$

$$(2.14) S(X,\xi) = -(n-1)\eta(X),$$

$$(2.15) S(\phi X, \phi Y) = S(X, Y) + (n-1)\eta(X)\eta(Y)$$

for any vector fields X, Y and Z, where R and S are the the curvature and Ricci the tensors of M, respectively.

A Kenmotsu manifold M is said to be generalized η Einstein if its Ricci tensor S is of the form

(2.16)
$$S(X,Y) = ag(X,Y) + b\eta(X)\eta(Y) + cg(\phi X, Y),$$

for any $X,Y\in\Gamma(TM)$, where a,b and c are scalar functions such that $b\neq 0$ and $c\neq 0$. If c=0 then M is called η Einstein manifold.

3. Generalized Symmetric Metric Connection in a Kenmotsu Manifold

Let $\overline{\nabla}$ be a linear connection and ∇ be a Levi-Civita connection of an almost contact metric manifold M such that

$$(3.1) \overline{\nabla}_X Y = \nabla_X Y + H(X, Y),$$

for any vector field X and Y. Where H is a tensor of type (1,2). For $\overline{\nabla}$ to be a generalized symmetric metric connection of ∇ , we have

(3.2)
$$H(X,Y) = \frac{1}{2}[T(X,Y) + T'(X,Y) + T'(Y,X)],$$

where T is the torsion tensor of $\overline{\nabla}$ and

(3.3)
$$g(T'(X,Y),Z) = g(T(Z,X),Y).$$

From (1.1) and (3.3) we get

$$(3.4) \quad T'(X,Y) = \alpha \{ \eta(X)Y - g(X,Y)\xi \} + \beta \{ -\eta(X)\phi Y - g(\phi X,Y)\xi \}.$$

Using (1.1), (3.2) and (3.4) we obtain

(3.5)
$$H(X,Y) = \alpha \{ \eta(Y)X - g(X,Y)\xi \} + \beta \{ -\eta(X)\phi Y \}.$$

Corollary 3.1. For a Kenmotsu manifold, generalized symmetric metric connection $\overline{\nabla}$ is given by

$$(3.6) \overline{\nabla}_X Y = \nabla_X Y + \alpha \{ \eta(Y) X - g(X, Y) \xi \} - \beta \eta(X) \phi Y.$$

If we choose $(\alpha, \beta) = (1, 0)$ and $(\alpha, \beta) = (0, 1)$, generalized metric connection is reduced to a semi-symmetric metric connection and quarter-symmetric metric connection as follows:

$$(3.7) \overline{\nabla}_X Y = \nabla_X Y + \eta(Y) X - g(X, Y) \xi,$$

$$(3.8) \overline{\nabla}_X Y = \nabla_X Y - \eta(X) \phi Y.$$

From (3.6) we have the following proposition

Proposition 3.1. Let M be a Kenmotsu manifold with generalized metric connection. We have the following relations:

$$(3.9) \qquad (\overline{\nabla}_X \phi) Y = (\alpha + 1) \{ q(\phi X, Y) \xi - \eta(Y) \phi X \},$$

$$(3.10) \overline{\nabla}_X \xi = (\alpha + 1) \{ X - \eta(X) \xi \},$$

$$(3.11) \qquad (\overline{\nabla}_X \eta) Y = (\alpha + 1) \{ q(X, Y) - \eta(Y) \eta(X) \},$$

for any $X, Y, Z \in \Gamma(TM)$.

4. Curvature Tensor on Kenmotsu manifold with generalized symmetric metric connection

Let M be an n- dimensional Kenmotsu manifold. The curvature tensor \overline{R} of the generalized metric connection $\overline{\nabla}$ on M is defined by

$$\overline{R}(X,Y)Z = \overline{\nabla}_X \overline{\nabla}_Y Z - \overline{\nabla}_Y \overline{\nabla}_X Z - \overline{\nabla}_{[X,Y]} Z,$$

Using the proposition 3.1, from (3.6) and (4.1) we have

$$(4.2)\bar{R}(X,Y)Z = R(X,Y)Z + \{(-\alpha^2 - 2\alpha)g(Y,Z) + (\alpha^2 + a)\eta(Y)\eta(Z)\}X$$

$$+ \{(\alpha^2 + 2\alpha)g(X,Z) + (-\alpha^2 - \alpha)\eta(X)\eta(Z)\}Y$$

$$+ \{(\alpha^2 + \alpha)[g(Y,Z)\eta(X) - g(X,Z)\eta(Y)]$$

$$+ (\beta + \alpha\beta)[g(X,\phi Z)\eta(Y) - g(Y,\phi Z)\eta(X)]\}\xi$$

$$+ (\beta + \alpha\beta)\eta(Y)\eta(Z)\phi X - (\beta + \alpha\beta)\eta(X)\eta(Z)\phi Y$$

where

(4.3)
$$R(X,Y)Z = \nabla_X \nabla_Y Z - \nabla_Y \nabla_X Z - \nabla_{[X,Y]} Z,$$

is the curvature tensor with respect to the Levi-Civita connection ∇ .

Using (2.10), (2.11), (2.12), (2.13) and (4.2) we give the following proposition:

Proposition 4.1. Let M be an n- dimensional Kenmotsu manifold with generalized symmetric metric connection of type (α, β) . Then we have the following equations:

$$(4.4) \quad \bar{R}(X,Y)\xi = (\alpha + 1)\{\eta(X)Y - \eta(Y)X + \beta[\eta(Y)\phi X - \eta(X)\phi Y]\}\$$

$$(4.5) \quad \bar{R}(\xi, X)Y = (\alpha + 1)\{\eta(Y)X - g(X, Y)\xi + \beta[\eta(Y)\phi X - g(X, \phi Y)\xi]\},\$$

(4.6)
$$\bar{R}(\xi, Y)\xi = (\alpha + 1)\{Y - \eta(Y)\xi - \beta\phi Y\},$$

(4.7)
$$\eta(\bar{R}(X,Y)Z = (\alpha+1)\{\eta(Y)q(X,Z) - \eta(X)q(Y,Z)\}$$

$$+\beta[\eta(Y)g(X,\phi Z) - \eta(X)g(Y,\phi Z)]$$

for any $X, Y, Z \in \Gamma(TM)$.

We know that Ricci tensor is defined by

$$\overline{S}(Y,Z) = \sum_{i=1}^{n} g(\overline{R}(e_i,Y)Z,e_i),$$

where $Y, Z \in \Gamma(TM)$, $\{e_1, e_2, ..., e_n\}$ is viewed as orthonormal frame. We can calculate the Ricci tensor with respect to generalized symmetric metric connection as follows:

$$\overline{S}(Y,Z) = S(Y,Z) + \{(2-n)\alpha^2 + (3-2n)\alpha\}g(Y,Z) + (n-2)(\alpha^2 + \alpha)\eta(Y)\eta(Z)$$
(4.8)
$$-(\beta + \alpha\beta)g(Y,\phi Z),$$

where S is Ricci tensor with respect to Levi-Civita connection.

Example 4.1. We consider a 3-dimensional manifold $M = \{(x, y, z) \in \mathbb{R}^3 : x \neq 0\}$, where (x, y, z) are the standard coordinates in \mathbb{R}^3 . Let E_1, E_2, E_3 be a linearly independent global frame on M given by

(4.9)
$$E_1 = x \frac{\partial}{\partial z}, \ E_2 = x \frac{\partial}{\partial y}, \ E_3 = -x \frac{\partial}{\partial x}.$$

Let g be the Riemannian metric defined by

$$g(E_1, E_2) = g(E_1, E_3) = g(E_2, E_3) = 0, g(E_1, E_1) = g(E_2, E_2) = g(E_3, E_3) = 1,$$

Let η be the 1-form defined by $\eta(U) = g(U, E_3)$, for any $U \in TM$. Let ϕ be the (1, 1) tensor field defined by $\phi E_1 = E_2, \phi E_2 = -E_1$ and $\phi E_3 = 0$. Then, using the linearity of ϕ and g we have $\eta(E_3) = 1$, $\phi^2 U = -U + \eta(U)E_3$ and $g(\phi U, \phi W) = g(U, W) - \eta(U)\eta(W)$ for any $U, W \in TM$. Thus for $E_3 = \xi$, (ϕ, ξ, η, g) an almost contact metric manifold is defined.

Let ∇ be the Levi-Civita connection with respect to the Riemannian metric g. Then we have

$$[E_1, E_2] = 0, [E_1, E_3] = E_1, [E_2, E_3] = E_2,$$

Using Koszul formula for the Riemannian metric g, we can easily calculate

(4.11)
$$\nabla_{E_1} E_1 = -E_3, \quad \nabla_{E_1} E_2 = 0, \quad \nabla_{E_1} E_3 = E_1, \\
\nabla_{E_2} E_1 = 0, \quad \nabla_{E_2} E_2 = -E_3, \quad \nabla_{E_2} E_3 = 0, \\
\nabla_{E_3} E_1 = 0, \quad \nabla_{E_3} E_2 = 0, \quad \nabla_{E_3} E_3 = 0.$$

From the above relations, it can be easily seen that

 $(\nabla_X \phi)Y = g(\phi X, Y)\xi - \eta(Y)\phi X$, $\nabla_X \xi = X - \eta(X)\xi$, for all $E_3 = \xi$. Thus the manifold M is a Kenmotsu manifold with the structure (ϕ, ξ, η, g) . for $\xi = E_3$. Therefore, the manifold M under consideration is a Kenmotsu manifold of dimension three.

5. Ricci and η -Ricci solitons on $(M, \phi, \xi, \eta, g,)$

Let (M, ϕ, ξ, η, g) be an almost contact metric manifold. Consider the equation

(5.1)
$$\mathcal{L}_{\varepsilon}q + 2\bar{S} + 2\lambda + 2\mu\eta \otimes \eta = 0,$$

where \mathcal{L}_{ξ} is the Lie derivative operator along the vector field ξ , \bar{S} is the Ricci curvature tensor field with respect to the generalized symmetric metric connection of the metric g, and λ and μ are real constants. Writing \mathcal{L}_{ξ} in terms of the generalized symmetric metric connection $\bar{\nabla}$, we obtain:

$$(5.2) 2\bar{S}(X,Y) = -g(\bar{\nabla}_X \xi, Y) - g(X, \bar{\nabla}_Y \xi) - 2\lambda g(X,Y) - 2\mu \eta(X)\eta(Y),$$

for any $X, Y \in \chi(M)$.

The data (g, ξ, λ, μ) which satisfy the equation (4.9) is said to be an η -Ricci soliton on M [10]. In particular, if $\mu = 0$ then (g, ξ, λ) is called Ricci soliton [6] and it is called shrinking, steady or expanding, according as λ is negative, zero or positive respectively [6].

Here is an example of η -Ricci soliton on Kenmotsu manifold with generalized symmetric metric connection.

Example 5.1. Let $M(\phi, \xi, \eta, g)$ be the Kenmotsu manifold considered in example 4.3.

Let $\overline{\nabla}$ be a generalized symmetric metric connection, we obtain: Using the above relations, we can calculate the non-vanishing components of the curvature tensor as follows:

$$R(E_1, E_2)E_1 = E_2, \ R(E_1, E_2)E_2 = -E_1, \ R(E_1, E_3)E_1 = E_3$$
(5.3)
$$R(E_1, E_3)E_3 = -E_1, \ R(E_2, E_3)E_2 = E_3, \ R(E_2, E_3)E_3 = -E_2$$

From the equations (5.3) we can easily calculate the non-vanishing components of the Ricci tensor as follows:

(5.4)
$$S(E_1, E_1) = -2, S(E_2, E_2) = -2, S(E_3, E_3) = -2$$

Now, we can make similar calculations for generalized metric connection. Using (3.6) in the above equations, we get

$$\overline{\nabla}_{E_1} E_1 = -(1+\alpha)E_3, \qquad \overline{\nabla}_{E_1} E_2 = 0. \qquad \overline{\nabla}_{E_1} E_3 = (1+\alpha)E_1,$$

$$(5.5) \qquad \overline{\nabla}_{E_2} E_1 = 0, \quad \overline{\nabla}_{E_2} E_2 = -(1+\alpha)E_3, \quad \overline{\nabla}_{E_2} E_3 = \alpha E_2,$$

$$\overline{\nabla}_{E_3} E_1 = -\beta E_2, \qquad \overline{\nabla}_{E_3} E_2 = \beta E_1, \qquad \overline{\nabla}_{E_3} E_3 = 0.$$

From (5.5), we can calculate the non-vanishing components of curvature tensor with respect to generalized metric connection as follows:

$$\overline{R}(E_1, E_2)E_1 = (1+\alpha)^2 E_2, \qquad \overline{R}(E_1, E_2)E_2 = -(1+\alpha)^2 E_1,
\overline{R}(E_1, E_3)E_1 = (1+\alpha)E_3, \qquad \overline{R}(E_1, E_3)E_3 = (1+\alpha)(\beta E_2 - E_1),
(5.6) \quad \overline{R}(E_2, E_3)E_2 = (1+\alpha)E_3, \qquad \overline{R}(E_2, E_3)E_3 = -(1+\alpha)(-\beta E_1 + E_2),
\overline{R}(E_3, E_2)E_1 = -(1+\alpha)\beta E_3, \qquad \overline{R}(E_3, E_1)E_2 = (1+\alpha)\beta E_3, .$$

From (5.6), the non-vanishing components of the Ricci tensor are as follows:

$$\overline{S}(E_1, E_1) = -(1+\alpha)(2+\alpha), \quad \overline{S}(E_2, E_2) = -(1+\alpha)(2+\alpha),$$
(5.7)
$$\overline{S}(E_3, E_3) = -2(1+\alpha).$$

From (5.2) and (5.5) we get

$$(5.8)2(1+\alpha)[g(e_i,e_i) - \eta(e_i)\eta(e_i)] + 2\bar{S}(e_i,e_i) + 2\lambda g(e_i,e_i) + 2\mu\eta(e_i)\eta(e_i) = 0$$

for all $i \in \{1, 2, 3\}$, and we have $\lambda = (1 + \alpha)^2$ (i.e. $\lambda > 0$) and $\mu = 1 - \alpha^2$, the data (g, ξ, λ, μ) is an η -Ricci soliton on (M, ϕ, ξ, η, g) . If $\alpha = -1$ which is steady and if $\alpha \neq -1$ which is expanding.

6. Parallel symmetric second order tensors and η -Ricci solitons in Kenmotsu manifolds

An important geometrical object in studying Ricci solitons is well known to be a symmetric (0,2)-tensor field which is parallel with respect to the generalized symmetric metric connection.

Now, let fix h a symmetric tensor field of (0,2)-type which we suppose to be parallel with respect to generalized symmetric metric connection ∇ that is $\nabla h = 0$. By applying Ricci identity [7]

(6.1)
$$\bar{\nabla}^2 h(X, Y; Z, W) - \bar{\nabla}^2 h(X, Y; Z, W) = 0,$$

we obtain the relation

(6.2)
$$h(\bar{R}(X,Y)Z,W) + h(Z,\bar{R}(X,Y)W) = 0.$$

Replacing $Z = W = \xi$ in (6.2) and by using (4.4) and by the symmetry of h it follows $h(\bar{R}(X,Y)\xi,\xi) = 0$ for any $X,Y \in \chi(M)$ and

(6.3)
$$(\alpha+1)\eta(X)h(Y,\xi) - (\alpha+1)\eta(Y)h(X,\xi)$$

(6.4)
$$+(\alpha+1)\eta(X)h(\xi,Y) - (\alpha+1)\eta(Y)h(\xi,X)$$

$$(6.5) + \beta \eta(Y)h(\phi X, \xi) - \beta \eta(X)h(\phi Y, \xi) + \beta \eta(Y)h(\xi, \phi X) - \beta \eta(X)h(\xi, \phi Y) = 0$$

Putting $X = \xi$ in (6.3) and by the virtue of (2.4), we obtain

(6.6)
$$2(\alpha+1)[h(Y,\xi) - \eta(Y)h(\xi,\xi)] - 2\beta h(\phi Y,\xi) = 0.$$

or

(6.7)
$$2(\alpha+1)[h(Y,\xi) - g(Y,\xi)h(\xi,\xi)] - 2\beta(\phi Y,\xi) = 0.$$

Suppose $(\alpha + 1) \neq 0$, $\beta = 0$ it results

(6.8)
$$h(Y,\xi) - \eta(Y)h(\xi,\xi) = 0,$$

for any $Y \in \chi(M)$, equivalent to

(6.9)
$$h(Y,\xi) - g(Y,\xi)h(\xi,\xi) = 0,$$

for any $Y \in \chi(M)$. Differentiating the equation (6.9) covariantly with respect to the vector field $X \in \chi(M)$, we obtain

$$(6.10) h(\bar{\nabla}_X Y, \xi) + h(Y, \bar{\nabla}_X \xi) = h(\xi, \xi) [g(\bar{\nabla}_X Y, \xi) + g(Y, \bar{\nabla}_X \xi)].$$

Using (4.4) in (6.10), we obtain

(6.11)
$$h(X,Y) = h(\xi,\xi)g(X,Y),$$

for any $X, Y \in \chi(M)$. The above equation gives the conclusion:

Theorem 6.1. Let $(M, \phi, \xi, \eta, g,)$ be a Kenmotsu manifold with generalized symmetric metric connection also with non-vanishing ξ -sectional curvature and endowed with a tensor field of type (0,2) which is symmetric and ϕ -skew-symmetric. If h is parallel with respect to ∇ , then it is a constant multiple of the metric tensor g.

On a Kenmotsu manifold with generalized symmetric metric connection using equation (3.10) and $\mathcal{L}_{\xi}g = 2(g - \eta \otimes \eta)$, the equation (5.2) becomes:

(6.12)
$$\bar{S}(X,Y) = -(\lambda + \alpha + 1)g(X,Y) + (\alpha + 1 - \mu)\eta(X)\eta(Y).$$

In particular, $X = \xi$, we obtain

(6.13)
$$\bar{S}(X,\xi) = -(\lambda + \mu)\eta(X).$$

In this case, the Ricci operator \bar{Q} defined by $g(\bar{Q}X,Y)=\bar{S}(X,Y)$ has the expression

(6.14)
$$\bar{Q}X = -(\lambda + \alpha + 1)X + (\alpha + 1 - \mu)\eta(X)\eta(X)\xi.$$

Remark that on a Kenmostu manifold with generalized symmetric metric connection, the existence of an η -Ricci soliton implies that the characteristic vector field ξ is an eigenvector of Ricci operator corresponding to the eigenvalue $-(\lambda + \mu)$.

Now we shall apply the previous results on η -Ricci solitons.

Theorem 6.2. Let (M, ϕ, ξ, η, g) be a Kenmotsu manifold with generalized symmetric metric connection. Assume that the symmetric (0, 2)-tensor filed $h = \mathcal{L}_{\xi}g + 2S + 2\mu\eta \otimes \eta$ is parallel with respect to the generalized symmetric metric connection associated to g. Then $(g, \xi, -\frac{1}{2}h(\xi, \xi), \mu)$ yields an η -Ricci soliton.

Proof. Now, we can calculate

(6.15)
$$h(\xi,\xi) = \mathcal{L}_{\xi}g(\xi,\xi) + 2\bar{S}(\xi,\xi) + 2\mu\eta(\xi)\eta(\xi) = -2\lambda,$$

so $\lambda = -\frac{1}{2}h(\xi,\xi)$. From (6.11) we conclude that $h(X,Y) = -2\lambda g(X,Y)$, for any $X,Y \in \chi(M)$. Therefore $\mathcal{L}_{\xi}g + 2S + 2\mu\eta \otimes \eta = -2\lambda g$. \square

For $\mu = 0$ follows $\mathcal{L}_{\xi}g + 2S - S(\xi, \xi)g = 0$ and this gives

Corollary 6.1. On a Kenmotsu manifold (M, ϕ, ξ, η, g) with generalized symmetric metric connection with property that the symmetric (0, 2)-tensor field $h = \mathcal{L}_{\xi}g + 2S$ is parallel with respect to generalized symmetric metric connection associated to g, the relation (5.1), for $\mu = 0$, defines a Ricci soliton.

Conversely, we shall study the consequences of the existence of η -Ricci solitons on a Kenmotsu manifold with generalized symmetric metric connection. From (6.12), we give the conclusion:

Theorem 6.3. If equation (4.9) defines an η -Ricci soliton on a Kenmotsu manifold (M, ϕ, ξ, η, g) with generalized symmetric metric connection, then (M, g) is quasi-Einstein.

Recall that the manifold is called *quasi-Einstein* [8] if the Ricci curvature tensor field S is a linear combination (with real scalars λ and μ respectively, with $\mu \neq 0$) of g and the tensor product of a non-zero 1-from η satisfying $\eta = g(X, \xi)$, for ξ a unit vector field and respectively, *Einstein* [8] if S is collinear with g.

Theorem 6.4. If (ϕ, ξ, η, g) is a Kenmotsu structure with generalized symmetric metric connection on M and (4.9) defines an η -Ricci soliton on M, then

- 1. $Q \circ \phi = \phi \circ Q$
- 2. Q and S are parallel along ξ .

Proof. The first statement follows from a direct computation and for the second one, note that

(6.16)
$$(\bar{\nabla}_{\xi}Q)X = \bar{\nabla}_{\xi}QX - Q(\bar{\nabla}_{\xi}X)$$

and

(6.17)
$$(\bar{\nabla}_{\xi}S)(X,Y) = \xi(S(X,Y)) - S(\bar{\nabla}_{\xi}X,Y) - S(X,\bar{\nabla}_{\xi}Y).$$

Replacing Q and S from (6.14) and (6.13) we get the conclusion. \square

A particular case arises when the manifold is ϕ -Ricci symmetric, which means that $\phi^2 \circ \nabla Q = 0$, as stated in the next theorem.

Theorem 6.5. Let (M, ϕ, ξ, η, g) be a Kenmotsu manifold with generalized symmetric metric connection. If M is ϕ -Ricci symmetric and (4.9) defines an η -Ricci soliton on M, then $\mu = 1$ and (M, g) is Einstein manifold [8].

Proof. Replacing Q from (6.14) in (6.16) and applying ϕ^2 we obtain

(6.18)
$$(\alpha + 1 - \mu)\eta(Y)[X - \eta(X)\xi] = 0,$$

for any $X, Y \in \chi(M)$. Follows $\mu = \alpha + 1$ and $S = -(\lambda + \alpha + 1)g$. \square

Remark 6.1. In particular, the existence of an η -Ricci soliton on a Kenmotsu manifold with generalized symmetric metric connection which is $Ricci \ symmetric$ (i.e. $\bar{\nabla}S=0$) implies that M is Einstein manifold. The class of Ricci symmetric manifold represents an extension of class of Einstein manifold to which the locally symmetric manifold also belong (i.e. $satisfying\ \bar{\nabla}R=0$). The condition $\bar{\nabla}S=0$ implies $\bar{R}.\bar{S}=0$ and the manifolds satisfying this condition are called $Ricci\ semi-symmetric\ [7]$.

In what follows we shall consider η -Ricci solitons requiring for the curvature to satisfy $\bar{R}(\xi,X).\bar{S}=0$, $\bar{S}.\bar{R}(\xi,X)=0$, $\bar{W}_2(\xi,X).\bar{S}=0$ and $\bar{S}.\bar{W}_2(\xi,X)=0$ respectively, where the W_2 -curvature tensor field is the curvature tensor introduced by G. P. Pokhariyal and R. S. Mishra in [21]:

(6.19)
$$W_2(X,Y)Z = R(X,Y)Z + \frac{1}{dimM - 1}[g(X,Z)QY - g(Y,Z)QX].$$

7. η -Ricci solitions on a Kenmotsu manifold with generalized symmetric metric connection satisfying $\bar{R}(\xi, X).\bar{S} = 0$

Now we consider a Kenmotsu manifold with with a generalized symmetric metric connection $\bar{\nabla}$ satisfying the condition

(7.1)
$$\bar{S}(\bar{R}(\xi, X)Y, Z) + \bar{S}(Y, \bar{R}(\xi, X)Z) = 0,$$

for any $X, Y \in \chi(M)$.

Replacing the expression of \bar{S} from (6.12) and from the symmetries of \bar{R} we get

$$(7.2) (\alpha + 1)(\alpha + 1 - \mu)[\eta(Y)g(X, Z) + \eta(Z)g(X, Y) - 2\eta(X)\eta(Y)\eta(Z)] = 0,$$

for any $X, Y \in \chi(M)$.

For $Z = \xi$ we have

(7.3)
$$(\alpha + 1)(\alpha + 1 - \mu)g(\phi X, \phi Y) = 0,$$

for any $X, Y \in \chi(M)$.

Hence we can state the following theorem:

Theorem 7.1. If a Kenmotsu manifold with a generalized symmetric metric connection $\bar{\nabla}$, (g, ξ, λ, μ) is an η -Ricci soliton on M and it satisfies $\bar{R}(\xi, X).\bar{S} = 0$, then the manifold is an η -Einstein manifold.

For $\mu = 0$, we deduce:

Corollary 7.1. On a Kenmotsu manifold with a generalized symmetric metric connection satisfying $\bar{R}(\xi, X).\bar{S} = 0$, there is no η -Ricci soliton with the potential vector field ξ .

8. η -Ricci solitons on Kenmotsu manifold with generalized symmetric metric connection satisfying $\bar{S}.\bar{R}(\xi,X)=0$

In this section, we have considered Kenmotsu manifold with a generalized symmetric metric connection \bar{S} satisfying the condition

(8.1)
$$\bar{S}(X, \bar{R}(Y, Z)W)\xi - \bar{S}(\xi, \bar{R}(Y, Z)W)X + \bar{S}(X, Y)\bar{R}(\xi, Z)W -$$

(8.2)
$$-\bar{S}(\xi, Y)\bar{R}(X, Z)W + \bar{S}(X, Z)\bar{R}(Y, \xi)W - \bar{S}(\xi, Z)\bar{R}(Y, X)W +$$

(8.3)
$$+\bar{S}(X,W)\bar{R}(Y,Z)\xi - \bar{S}(\xi,W)\bar{R}(Y,Z)X = 0$$

for any $X, Y, Z, W \in \chi(M)$.

Taking the inner product with ξ , the equation (8.1) becomes

$$(8.4) \quad \bar{S}(X, \bar{R}(Y, Z)W) - \bar{S}(\xi, \bar{R}(Y, Z)W)\eta(X) + \bar{S}(X, Y)\eta(\bar{R}(\xi, Z)W) -$$

$$(8.5) -\bar{S}(\xi, Y)\eta(\bar{R}(X, Z)W) + \bar{S}(X, Z)\eta(\bar{R}(Y, \xi)W) - \bar{S}(\xi, Z)\eta(\bar{R}(Y, X)W) +$$

(8.6)
$$+\bar{S}(X,W)\eta(\bar{R}(Y,Z)\xi) - \bar{S}(\xi,W)\eta(\bar{R}(Y,Z)X) = 0$$

for any $X, Y, Z, W \in \chi(M)$.

For $W = \xi$, using the equation (4.4), (4.5), (4.7) and (6.12) in (8.4), we get

$$(\alpha+1)(2\lambda+\mu+\alpha+1)[g(X,Y)\eta(Z)-g(X,Z)\eta(Y)+\beta g(\phi X,Y)\eta(Z)-g(\phi X,Z)\eta(Y)]$$
 (8.7)

for any $X, Y, Z, W \in \chi(M)$.

Hence we can state the following theorem:

Theorem 8.1. If (M, ϕ, ξ, η, g) is a Kenmotsu manifold with a generalized symmetric metric connection, (g, ξ, λ, μ) is an η -Ricci soliton on M and it satisfies $\bar{S}.\bar{R}(\xi, X) = 0$. Then

$$(8.8) (\alpha + 1)(2\lambda + \mu + \alpha + 1) = 0.$$

For $\mu = 0$ follows $\lambda = -\frac{\alpha+1}{2}$, $(\alpha \neq -1)$, therefore, we have the following corollary:

Corollary 8.1. On a Kenmotsu manifold with a generalized symmetric metric connection, satisfying $\bar{S}.\bar{R}(\xi,X)=0$, the Ricci soliton defined by (5.1), $\mu=0$ is either shrinking or expanding.

9. η -Ricci soliton on (ε) -Kenmotsu manifold with a semi-symmetric metric connection satisfying $\bar{W}_2(\xi,X).\bar{S}=0$

The condition that must be satisfied by \bar{S} is

$$\bar{S}(\bar{W}_2(\xi, X)Y, Z) + \bar{S}(Y, \bar{W}_2(\xi, X)Z) = 0,$$

for any $X, Y, Z \in \chi(M)$.

For $X = \xi$, using (4.4), (4.5), (4.7), (6.12) and (6.19) in (9.1), we get

$$(9.2) \qquad \frac{(\alpha+1-\mu)(-2\mu-2\lambda+(4\alpha+4)n)}{n}\eta(Y)\eta(Z)$$

for any $X, Y, Z \in \chi(M)$. Hence, we can state the following:

Theorem 9.1. If (M, ϕ, ξ, η, g) is an (2n + 1)-dimensional Kenmotsu manifold with a generalized symmetric metric connection, (g, ξ, λ, μ) is an η -Ricci soliton on M and $\bar{W}_2(\xi, X).\bar{S} = 0$, then

$$(9.3) \qquad (\alpha + 1 - \mu)(-2\mu - 2\lambda + (4\alpha + 4)n) = 0.$$

For $\mu=0$ follows that $\lambda=\frac{(4\alpha+4)n}{2}, (\alpha\neq -1)$, therefore, we have the following corollary:

Corollary 9.1. On a Kenmotsu manifold with a generalized symmetric metric connection, satisfying $\bar{W}_2(\xi, X).\bar{S} = 0$, the Ricci soliton defined by (5.1), $\mu = 0$ is either shrinking or expanding.

10. η -Ricci soliton on Kenmotsu manifold with a generalized symmetric metric connection satisfying $\bar{S}.\bar{W}_2(\xi,X)=0$

In this section, we have considered an (ε) -Kenmotsu manifold with a semi-symmetric metric connection $\bar{\nabla}$ satisfying the condition

$$(10.1) \qquad \bar{S}(X, \bar{W}_2(Y, Z)V)\xi - \bar{S}(\xi, \bar{W}_2(Y, Z)V)X + \bar{S}(X, Y)\bar{W}_2(\xi, Z)V -$$

$$(10.2) \quad -\bar{S}(\xi, Y)\bar{W}_2(X, Z)V + \bar{S}(X, Z)\bar{W}_2(Y, \xi)V - \bar{S}(\xi, Z)\bar{W}_2(Y, X)V +$$

(10.3)
$$+\bar{S}(X,V)\bar{W}_2(Y,Z)\xi - \bar{S}(\xi,V)\bar{W}_2(Y,Z)X = 0,$$

for any $X, Y, Z, V \in \chi(M)$.

Taking the inner product with ξ , the equation (10.1) becomes

$$(10.4) \ \bar{S}(X, \bar{W}_2(Y, Z)V) - \bar{S}(\xi, \bar{W}_2(Y, Z)V)\eta(X) + \bar{S}(X, Y)\eta(\bar{W}_2(\xi, Z)V) - \bar{S}(\xi, \bar{W}_2(Y, Z)V) - \bar{S}(\xi, \bar{W}_2$$

$$(10.5)$$
 $\bar{S}(\xi, Y)\eta(\bar{W}_2(X, Z)V) + \bar{S}(X, Z)\eta(\bar{W}_2(Y, \xi)V) - \bar{S}(\xi, Z)\eta(\bar{W}_2(Y, X)V) +$

(10.6)
$$+\bar{S}(X,V)\eta(\bar{W}_2(Y,Z)\xi) - \bar{S}(\xi,V)\eta(\bar{W}_2(Y,Z)X) = 0,$$

for any $X, Y, Z, V \in \chi(M)$.

For $X = V = \xi$, using (4.4), (4.5), (4.7), (6.12) and (6.19) in (10.4), we get

$$(10.7)\{-(\alpha+1)(2\lambda+\alpha+1+\mu)+\frac{(\lambda+\alpha+1)^2+(\lambda+\mu)^2}{2n}\}\{\eta(X)\eta(Y)-g(X,Y)\}$$

(10.8)
$$+\beta(\alpha+1)(2\lambda+\alpha+1+\mu)q(\phi X,Y)=0,$$

for any $X, Y, Z \in \chi(M)$. Hence, we can state:

Theorem 10.1. If (M, ϕ, ξ, η, g) is a (2n+1)-dimensional Kenmotsu manifold with generalized symmetric metric connection, (q, ξ, λ, μ) is an η -Ricci soliton on M and $S.W_2(\xi,X)=0$, then

(10.9)
$$-(\alpha+1)(2\lambda+\alpha+1+\mu) + \frac{(\lambda+\alpha+1)^2 + (\lambda+\mu)^2}{2n} = 0,$$

and

(10.10)
$$\beta(\alpha + 1)(2\lambda + \alpha + 1 + \mu) = 0.$$

For $\mu = 0$ we get the following corollary:

Corollary 10.1. On a Kenmotsu manifold with a generalized symmetric metric connection satisfying $S.W_2(\xi,X)=0$, the Ricci soliton defined by (5.1), for $\mu=0$, we have the following expressions:

(i)
$$-(\alpha+1)(2\lambda+\alpha+1)+\frac{(\lambda+\alpha+1)^2+(\lambda)^2}{2n}=0$$
 and $\beta(\alpha+1)(2\lambda+\alpha+1)=0$.
(ii) If $\alpha=-1$ or $\alpha=-2\lambda-1$ which is steady.
